

Problem Set 08: Relational & Logical Operators

New Learning Objectives under Evaluation

14.00 Perform and evaluate relational and logical operations

| Learning Objective | Evidence |
|---|---|
| 14.01 Construct relational and logical statements from English statements | <p>Identify correct true/false pattern for the English statement</p> <p>Logical statement is correct</p> <p>Complete work is shown when verifying that the logical statement results in the pattern identified</p> <p>Logical statement is only as complicated as necessary</p> |
| 14.02 Employ relational operators with arrays (scalars, vectors, matrices) | <p>Variables or values are placed correctly within the statement(s)</p> <p>Complete work is shown when evaluating expressions</p> <p>Arrays must have the same dimensions (unless one is a scalar)</p> <p>Correct syntax for relational operators (>, >=, <, <=, ==, ~=)</p> <p>Evaluate or use appropriate relational operators to compare arrays</p> <p>Apply output of relational operation as logical true/false</p> |
| 14.03 Employ order of operations to perform calculations, comparisons, and logical operations | <p>Variables or values are placed correctly within the statement(s)</p> <p>Complete work is shown when evaluating expressions</p> <p>Apply the MATLAB order of precedence:</p> <ol style="list-style-type: none"> 1. Parentheses () 2. Transpose (.'), power (.^), complex conjugate transpose ('), matrix power (^) 3. Logical negation (~) 4. Multiplication (.*), right division (./), left division (.\), matrix multiplication (*), matrix right division (/), matrix left division (\) 5. Addition (+), subtraction (-) 6. Less than (<), less than or equal to (<=), greater than (>), greater than or equal to (>=), equal to (==), not equal to (~=) 7. Element-wise AND (&) 8. Element-wise OR () 9. Short-circuit AND (&&) 10. Short-circuit OR () <p>In the absence of parentheses, operators at the same level are read left to right (with some exceptions that are not discussed in ENGR 132, see https://www.mathworks.com/help/matlab/matlab_prog/operator-precedence.html)</p> <p>The mathematical expression $a < x < b$ be coded as <code>a < x & x < b</code></p> |

Problem Set 08: Relational & Logical Operators

New Learning Objectives under Evaluation

| | |
|---|---|
| <p>14.04 Employ comparison functions with vectors and matrices: any, all</p> | <p>Correct syntax for any command: any(X)</p> <p>Correct syntax for any command: all(X)</p> <p>Use and evaluate vectors or matrices with zero and non-zero value elements within the any command</p> <ul style="list-style-type: none"> any(vector) operates on the full vector and returns a logical scalar of 1 if a single value is a non-zero value any(matrix) operates on the columns of matrix and returns a corresponding vector of logical elements where the values of 1 indicate columns with one or more non-zeros values <p>Use and evaluate vectors or matrices with zero and non-zero value elements within the all command</p> <ul style="list-style-type: none"> all(vector) operates on the full vector and returns a logical scalar of 1 if every value is a non-zero value all(matrix) operates on the columns of matrix and returns a corresponding vector of logical elements where the values of 1 indicate columns with all non-zeros values <p>Differentiate between appropriate use of any or all</p> <p>Apply output from any or all command as logical true/false</p> |
| <p>14.05 Employ comparison functions with vectors and matrices: find</p> | <p>Correct syntax for find(x)</p> <p>Evaluate a call to find</p> <p>Recognize that the output of find is an array of indices for which the logic statement is true</p> <p>Apply output of find as indices</p> |
| <p>14.06 Employ logical operations with arrays (scalars, vectors, matrices)</p> | <p>Variables or values are placed correctly within the statement(s)</p> <p>Complete work is shown when evaluating expressions</p> <p>Arrays have the same dimension (unless one is a scalar)</p> <p>Correct syntax for logical operators (&, , ~)</p> <p>Correct syntax for xor command: xor(X)</p> <p>Evaluate or use appropriate logical operators with arrays</p> <ul style="list-style-type: none"> Exclusive or (xor) returns true when only one element is true Inclusive or () returns true when one or both elements are true AND (&) returns true when both elements are true <p>Example: The mathematical expression $a < x < b$ is coded as $a < x \& x < b$</p> <ul style="list-style-type: none"> Logical negation (~) reverse the output (true to false, false to true) |

Problem Set 08: Relational & Logical Operators

New Learning Objectives under Evaluation

| | |
|--|---|
| | Apply output of logical operation as logical true/false |
| 14.07 Construct truth tables to evaluate logical expressions | <p>When there are two variables:</p> <ul style="list-style-type: none"> • a 2x2 table is used • 2 columns for variable 1 (T/F) • 2 rows for variable 2 (T/F) <p>When there are three variables:</p> <ul style="list-style-type: none"> • a 2x4 (or 4x2) table is used • 4 columns for an orderly presentation of all combinations of variable 1 (T/F) and variable 2 (T/F) • 2 rows for variable 3 (T/F) <p>When there are four variables:</p> <ul style="list-style-type: none"> • a 4x4 table is used • 4 columns for an orderly presentation of all combinations of variable 1 (T/F) and variable 2 (T/F) • 4 rows for an orderly presentation of all combinations of variable 3 (T/F) and variable 4 (T/F) |
